

# MULTIPOLL

## Features:

- Polls and sets time on up to 99 Ethernet or Modem Clocks simultaneously.
- Utilizes Digiboards or USB hub for modem operation. Ethernet requires no special equipment.
- Prefix allows mixing of dial prefix and direct dial phone lines.
- Works through manual poll or auto polling processes.
- Supports 500, 600, 700 Series and Hand Reader terminals.

*Multiplexes the Polling Process  
Automated • Fast • Cost Effective*

Time America's Multipoll is a software module for the GENESIS PRO or SQL Time & Attendance Systems that allows you to poll and set time on up to 99 Ethernet or Modem Clocks simultaneously. Simple to use setup screens define which computer ports are available and which clocks will be assigned to each port. In addition, the communication method for each port is also defined.

Each port can have its own modem or in the case of Ethernet each terminal's IP address can be defined for simultaneous polling.

Multipoll will poll all defined clocks at the same time, cutting your polling time to a fraction of standard sequential polling methods. The software monitor keeps track of the polling process informing you of the current polling status.
